

Zev

Everyday shopping within limits you choose

Your shopping agent, with a spending boundary

Tell Zev what you need. Authorize a budget.
It compares offers and checks every purchase.

Trust / E-commerce / Agent / Payment

FinTech - Problem Statement 1

Agentic Commerce

AI shopping still faces a trust barrier

People already use AI to shop. Letting it complete the purchase is a different decision.

Survey measure

Hong Kong consumers

Have used AI assistants for shopping

74%

Uncomfortable letting AI complete a purchase¹

45%

0% 25% 50% 75% 100%

Share of respondents (%)

¹ Even after reviewing and approving the product and price. Independent measures, not a funnel.

Four dimensions, one complete purchase

Example request: “Restock laundry liquid, 2L or more, under HK\$150.”

01	02	03	04
Trust	E-commerce	Agent	Payment
Permission	A suitable basket	Work delegated	A checked charge
HK\$150 per order HK\$300 total 2 purchases, 7 days	Compare both stores Include delivery Keep the chosen cart	Read the request Search and explain Handle follow-ups	Choose an eligible rail Recheck at settlement Keep a linked receipt

The mandate is the user’s permission. Every dimension refers back to it.

Trust: permission has explicit limits

A signed mandate defines the budget, purchase count, expiry and conditions that require a question.

HK\$150 per order

HK\$300 total / 2 purchases / 7 days

BUY All applicable rules pass

ASK A review condition needs your OK

BLOCK A hard limit fails

**HK\$158 exceeds the cap.
Confirmation cannot bypass the refusal.**

E-commerce: compare the full basket

A lower item price can disappear once delivery is included. The cap applies to the final charge.

HK\$138

Both 2L offers cost the same with shipping.

HK\$158: blocked

Agent: turn a request into a draft

The agent reads the request. The user authorizes the limits. Rules decide whether payment can proceed.

3 days

7 days

14 days

“Buy a bottle of dish soap.”

01 Understand

Keep the product named by the user.

02 Draft

Expose limits as editable fields.

03 Compare

Search and explain offers under the mandate.

04 Respect authority

Model output cannot raise caps or authorize payment.

Payment: eligibility and funding decide the rail

The current example pays from the Agent pocket using Tap & Go. Both shown local-HKD fees are zero.

Tap & Go Mastercard

Mastercard · T+1 (simulated)

1 · ALLOWED?

✓ Allowed by your mandate

✓ Riri Fresh Mart accepts it

✓ Enabled by you

2 · WHAT YOU PAY

HK\$138.00

Consumer fee: HK\$0.00

Zev uses this

Cash funds the pocket.
A mandate sets permission.

Allowed by the mandate

Accepted by the merchant and enabled by the user

Tap & Go HK\$0 fee

FPS HK\$0 fee

Tap & Go matches the pocket’s funding.
An FPS-only mandate changes the eligible rail.

Trust: protect changes that redirect value

Address changes and wider permissions deserve their own protection, even after someone has signed in.

ADDRESS

Where things go

Changing it needs your passkey, waits 24 hours and sends you an SMS. Even with your account, nobody can quietly redirect a parcel.

Current

3/F, Lady Ho Tung Hall, HKU, Pok Fu Lam Road

New address

New delivery address

Request with passkey

Why the 24-hour wait

Redirecting parcels is the first thing a thief tries. The wait plus an SMS gives you time to notice and cancel. In this demo it's 2 minutes.

24 hours

Intended time for the owner to notice and cancel a suspicious address change

Tightening and freezing act immediately.
Loosening follows a separate verification flow.

E-commerce + Agent: preferences and permissions

Product data and personal preferences guide recommendations. Neither grants spending authority.

Personal taste stays optional

Preferences rank choices.
They do not expand spending rights.

Suspicious text stays data

“Ignore the budget” appears in a listing.

The original mandate still applies.
The work log records the ignored instruction.

Payment: every charge has a traceable basis

The order connects the mandate version, candidate decisions, payment method and receipt.

HK\$118 + HK\$20 + HK\$0 = HK\$138

Item	Delivery	Fee	Total
1	Recheck	Read current rules and the cart version.	
2	Settle together	Update allowance, uses, stock and balances.	
3	Explain later	Keep the mandate, decision and receipt linked.	

HK\$162 allowance left. One purchase remaining.

Value starts with repeat household shopping

For young adults who already know their preferences and want less work each time they restock.

Who / problem	What Zev changes	Evidence to collect
Shoppers repeat the same checks	Reuse budget, count and expiry. Review only defined exceptions.	First-use and repeat-task time. Can users predict buy / ask / block?
Merchants explain order issues	Link the order to the permission and recorded decision.	Time to explain a disputed order. Eligible purchase completion.
Wallets need bounded delegation	Add shopping under explicit limits with a linked payment record.	Repeat delegation and support effort. Control failures and duplicate charges.

Our focus

Reusable limits in an everyday shopping experience.
ACP and AP2 provide relevant foundations (appendix 16).

Commercial hypothesis: integration fee + subscription for wallets or commerce platforms.

Zev makes delegated shopping inspectable

A complete purchase connects permission, product choice, agent work and payment evidence.

Appendix: demonstrated capability and remaining work

The prototype provides evidence of the experience. Production guarantees need separate validation.

Observed on the website	Named-product draft, full basket comparison, buy / ask / block, follow-up on the same task, payment explanation and receipt.
Implemented in local backend	Deterministic decisions, fresh settlement checks, idempotency, transactional quota, stock, balance and journal updates.
Simulated or not yet verified	Payment rails, merchant catalogue, passkey / PIN and SMS. Address-delay enforcement requires server-side hardening.
Evidence still to collect	End-to-end security and concurrency results for the deployed build. Timed user study, repeat usage and willingness to pay.

Appendix: a demonstration for each dimension

Each route gives a concrete answer to a judging question.

Trust

What stops an over-budget order?

/task/s3 and /mandate/md_daily

E-commerce

Can I keep personal choice?

/task/c1

Agent

What happens after “arrives today”?

New dish-soap draft, then a follow-up

Payment

Why this rail, and what did it charge?

/pay-methods and the latest paid task

Security detail: /me/security and /me/address

Appendix: sources and evidence

Product evidence checked on 4 October 2026. Full URLs and scope notes appear in PowerPoint speaker notes.

Appendix: existing approaches and Zev’s focus

Comparison of roles and workflows. Protocols already support commerce and authorization.

Approach	What it provides	Where Zev focuses
Manual shopping	The shopper compares baskets and approves each purchase.	A reusable mandate for repeat shopping, with defined exceptions.
Advice-only AI workflow	Suggests products. The user still checks the basket and buys.	Delegates execution within rules. Sends exceptions to the user.
ACP / agentic checkout	Agent-to-merchant checkout. The merchant processes payment.	Shopping decisions and permission controls around the checkout flow.
AP2 / payment mandates	Verifiable intent and cart mandates. Supports delegated purchases.	A concrete household workflow that exposes buy / ask / block.
Zev prototype	Editable limits, full-basket choice, rule outcomes and linked receipts.	End-to-end experience today. Protocol / rail integration proposed.

The distinction is the workflow and implementation.

No claim that Zev invented mandates, outperforms these systems or already integrates with them.

Appendix: a proposed path to real payment

Zev checks permission. A contracted payment provider processes funds and returns the result.

1 Permission	2 Request	3 Payment	4 Reconcile
Zev backend	Provider adapter	Wallet / PSP	Zev + provider
Recheck current limits, cart and revocation.	Send amount, merchant and an idempotency key.	Verify the payer. Return payment status.	Verify callback or poll. Link order and receipt.

FPS entry route	Through a participating bank or licensed wallet. Start with customer-confirmed payment. Unattended debit requires a supported provider mandate and explicit consent.
Card / wallet route	Contracted provider with tokenized credentials and merchant onboarding. API access, supported permissions and callback verification remain dependencies.

Timeout stays pending. Reconcile before retrying. Confirm failure before releasing a reservation.
